

**PROBLEM**

**Accurate building footprints are hard to find**

- Most pre-built databases are not up to date and miss key features e.g. sheds
- Fresh building footprint extraction is time consuming and expensive
- Very few precise datasets available, instead most datasets have been created using coarser satellite imagery

**Building footprint extraction as a service**

- Footprints can be easily requested on area of interest and source imagery of choice
- Ability to instantly detect on-ground changes using robust computer vision models
- Quick turnaround time on the footprints ensures faster network planning and higher customer satisfaction

**SOLUTION**

**IMPACT**

**3X**  
faster than other feature  
extraction services

**25-30%**  
more coverage than  
open street maps

**20M+**  
square meter of area  
analysed
